Why I Choose these assets:

Rationale for Selecting These Assets

Product Images: I used the website Pexels for all the product images because it provides high quality photos for commercial use without requiring any payment from users. Images like for the heritage tomatoes photo contains both red and yellow tomatoes to indicate the colour mix of the product, Sourdough Loaf photo features the shape and crust of the bread product, these real photos enhance the professionalism of the web design compared to using icons to represent products. It will show the customers what they are buying and will build trust as well.

Map API: I decided to use Leaflet with OpenStreetMap for the map API because both tools were suitable for the current website since they were completely free. They did not require an API key to access their services. The map API would showcase the locations of the producers to the customers and the users. The customers will know where there food is coming from and will also promote local producers and farmers. I used OpenStreetMap because it is a reputable opensource service which provides high quality maps across the globe for various application.

Custom Map Markers: To create map markers, I used a leaf emoji that matches with the brand colours of the website. also leaf emoji would be perfect since the company deals with local food.

Fallback Images: For images on the website I included a fallback function. It is important because sometimes the picture does not get loaded due to some reason. So to provide customers with better user experience incase if there is no picture available a relevant emoji will pop up instead. It will depend on what category of products the emoji represents like if the product is a vegetable then the picture will show a carrot emoji.
